Documentation index

This project's documentation follows the Diátaxis framework: four kinds of document, each with a different job. Technical docs are written in ASD-STE100 Simplified Technical English (short sentences, active voice, one meaning per word).

Start here

- **New to the tool?** Read the tutorial: `tutorial/getting-started.md`.
- **Want the math and the "why"?** Read the white paper: `white-paper.md`.

Tutorial — learning-oriented

- `tutorial/getting-started.md` — a first session, with the wagers that the app shows at each step.

How-to guides — task-oriented

- `how-to/get-a-wager-recommendation.md`
- `how-to/practice-with-quiz-mode.md`
- `how-to/maintain-the-project.md`

Reference — information-oriented

- `reference/engine-api.md` — each public function, constant and dataclass in `engine/` (including the simulated contestant behavior in `behavior.py`), with parameter and return-value tables.

Explanation — understanding-oriented

- `white-paper.md` — the full research, math, and methodology.
- `explanation/tiers-explained.md` — a plain-language companion to the white paper's Tier 1 / Tier 2 discussion.
- `explanation/wagering-theory-research.md` — the original research memo the white paper consolidates.

Decision records and reviews

- `adr/0001-data-source-strategy.md`
- `adr/0002-opponent-model-assumptions.md` — superseded by ADR-0003; kept as the historical record.

- `adr/0003-simulated-contestant-behavior.md` — the tiebreaker rule and the simulated opponents of Tier 2 and the Daily Double engine.
- `adr/0004-modern-era-calibration.md` — the private calibration of the simulated opponents to modern-era play (Seasons 38-41), and the accepted J! Archive terms-of-use risk.
- `reviews/statistical-review-2026-07-23.md` — first statistical review (Daily Double wager selection, and the strict-win tiebreak that 2.0.0 removed).
- `reviews/statistical-review-2026-07-23-v2.md` — referee-style second review (CRN-aware comparison variance + multiplicity).

Presentation

- `deck.pptx` — a plain-English overview. The last slide links the white paper.

Generated PDFs

Each Markdown document here has a PDF companion in `../build/`. The Markdown is the source of truth. When the source changes, regenerate the PDF in the same pass with `python build/md_to_pdf.py <source.md> build/<name>.pdf` (see `how-to/maintain-the-project.md`).
