# Security Policy

## Security Policy

### Scope

This is a personal research and practice-tool project. It has no server, no database, no user accounts, and no network calls of its own — the `app/index.html` trainer runs entirely client-side in a browser, and the `engine/` Python code runs locally. The realistic attack surface is small: mainly the risk of a dependency or a copy-pasted code snippet introducing a problem.

### Reporting a vulnerability

If you find a security issue (for example, something that could execute unexpected code when `app/index.html` is opened, or an unsafe dependency in the Python engine), email **willjhooper@msn.com** with a description and steps to reproduce. This is a solo personal project, so please allow a reasonable amount of time for a response – there's no dedicated security team behind it.

### Data handling

- The trainer's Quiz Mode stores a score/streak counter in the browser's `localStorage`. That's the only persisted data in this project, and it never leaves the browser.
- No scores, wagers, or personal information are transmitted anywhere.
- No historical Jeopardy! data is scraped, stored, or shipped by this project – see `docs/adr/0001-data-source-strategy.m` for why.
